Students in Big History collaborate to study a unified story of history. Students investigate common patterns across the entirety of history, from the creation of the universe to the Common Era and beyond. The study of history as a whole enables students to better understand people, civilization, and our place in the universe. In addition, this unified story provides students with a deeper awareness of our past, better preparing them to help shape the future. Students employ a web-based curriculum provided by the Big History Project. As students study the patterns of history, they develop a critical-thinking skill and engaged in 21st Century Learning.

### Essential Question:
- **What is Big History?**
- How has our understanding of the universe evolved?
- In what ways do the stars serve our solar system?
- What theories may explain the creation of our solar system?
- How is it possible to define life?
- What makes humans different?

### Content:
- **Course Overview/Reasons for Studying History**
  - The Big Bang Stars and Elements
  - The Solar System and Earth
  - Life
  - Early Humans

### Skills and Topics:
- **summarize the major origin stories and**
- **identify the major features/attributes of origin stories**
- **Compare and contrast origin stories,**
- **Analyze various texts and visuals to assess diverse historical perspectives,**
- **Debate reasons for learning about Big History,**
- **Assess the major disciplines that contribute to the study from which big history draws evidence to construct a modern**
- **Analyze claims in articles, essays, and stories regarding the Big Bang Theory,**
- **Compare and contrast three models of the universe (such as: Ptolemy, Newton, and Hubble),**
- **Collaborate to provide different approaches to knowledge and technological innovations (e.g. parallax, Doppler Effect, spectroscope, absorption lines, red shift),**
- **Analyze how changing of our understanding**
- **Describe the position of our Solar System in the Milky Way galaxy,**
- **Create a spatial scale of the Solar System, including the size of planets and the distance between planets,**
- **Contrast how our Sun’s formation 4.5 billion years ago was different from the first generation of stars,**
- **Define the process of accretion and the formation of the rocky planets, citing evidence scientists use to explain this process,**
- **Differentiate living from non-living things,**
- **Investigate the function of DNA and the evidence that provides for the relationship among living organisms,**
- **Connect the Goldilocks Conditions to the origination of life on Earth,**
- **Research how living things adapt and evolve,**
- **Analyze the six major turning in the history of life on Earth,**
- **Assess the methods**
- **Track the major steps in the development of homo sapiens,**
- **Distinguish characteristics among organisms along the evolutionary path,**
- **Evaluate the evidence used to support the theory of human evolution,**
- **Assess the qualities that make the human species distinctive (e.g. symbolic language and collective learning),**
- **Analyze Paleolithic communities and their cultures,**
- **Analyze factors that
| scientific origin story (such as Biology, Chemistry, Physics-Anthropology, etc.) | of our universe is an example of collective learning. |
| Synthesize learning in the completion of the Investigation Problem. | Synthesize learning in the completion of the Investigation Problem. |
| • Assess how scientists are able to construct the story of the Big Bang. | • Compare and contrast the rocky and gasy planets in our Solar System. |
| • Determine the fundamental forces that emerged from the Big Bang. | • Research the most widely accepted theory for how Earth’s moon was formed. |
| • Describe the roles that gravity, hydrogen and helium, and the process of nuclear fusion play in the formation of stars | • Analyze the formation of the Earth’s layers including the structure and function of each of the layers that formed. |
| • Determine the Goldilocks Conditions that enabled the creation of stars | • Track the process and conditions that evolved on early earth that allowed for life to develop. |
| • Explain what evidence scientists have used to understand the creation and lifecycle of stars | • Research both the theory of plate tectonics and its connection to the Big History story. |
| • Illustrate the relationship between the lifecycle of stars and creation of new elements identified on the periodic table | • Differentiate among eons, eras, periods, epochs, and ages on a geologic time scale, and explain absolute dates on Earth. |
| • Synthesize learning in the completion of the Investigation Problem. | • Synthesize learning in the completion of the Investigation Problem. |

| made human adaptation to different climates and environments possible. | scientists use to situate living things and changes in living things on the geologic time scale |
| • Research the concept of the biosphere, interactions between humans and the environment, and the impact of the environment on human development. | • Collaborate to explain the astronomical, geological, and biological forces that have shaped the history of life within the biosphere. |
| • Synthesize learning in the completion of the Investigation Problem. | • Assess how a great diversity of species increases the chance some living organisms will survive in the face of dramatic changes in the environment. |

| made human adaptation to different climates and environments possible. | scientists use to situate living things and changes in living things on the geologic time scale |

KEY COMPONENTS OF BIG HISTORY

The Big History Project (BHP) includes content related to New Jersey Student Learning Standards for Social Science for both world history and US history and applies to the Next Generation Science Standards (NGSS). BHP provides a review of middle school content related to the human story from emergence to the beginning of the age of exploration, placing it in a larger context. In addition, it prepares students for the more elaborated and critical study of human history from the Renaissance to the present.

Chronological Thinking
By the end of high school, Big History students should not only be able to use chronological thinking to compare events, but also to evaluate their consequences for the present day. BHP supports students’ abilities to consider change over time and encourages increasingly complex consideration of the import and impacts of beliefs, values, technology, politics, and economic forces. BHP helps strengthen the foundation for such complex thinking. The Investigations in each unit provide good opportunities to link various factors like these as students consider causation and change over time. For example, the Investigation in Unit 4 has students read a range of sources to create a timeline that accounts for the gradual acceptance of David Wegener’s Theory of Plate Tectonics. In Unit 9, students consider population trends, literacy rates, the spread of democracy, carbon dioxide levels over time, and several other factors as part of writing an essay on whether the Modern Revolution has been a positive or negative technical, social, and cultural force (see lesson 9.3). BHP also focuses on the concept of periodization in history, providing a meta-discussion of how historians and others think about time.

Spatial Thinking
Spatial thinking is built into the BHP framework. One foundational concepts is the “four world zones” of human habitation – that the move from agricultural civilizations to the modern world was largely made possible by interconnections among the four world zones resulting from exploration, trade, and migration.

As indicated by that last example, the senior high expectation that students be able to construct graphic representations of human and physical spatial phenomena is practiced in BHP. In almost every unit, students map journeys or migration routes (see example activities in Lessons 4.2, 7.1 and 8.1), actively compare developments in different locations (e.g., the “Comparing Civilizations” project in Unit 7), and show the movement of people and goods around the world. In the World Zones Game in Unit 8, which reinforces the idea that the intersection of populations, resources and innovations influences outcomes for people in particular locations, students create a continent. In addition, senior NJ students are supposed to “Relate current events to the physical and human characteristics of places and regions.” In Lesson 8.3, the “Personal Supply Chain” activity has students choose one item they own and map its provenance back to its raw materials, thus connecting what they are studying about 18th and 19th-century world exchange to their present reality. In Units 9 and 10, students spend time considering current and future energy use patterns in relation to global issues.

Critical Thinking
In its focus on argumentative writing, debate, and challenging previously held assumptions, BHP develops critical thinking throughout the course. From the beginning of the year, BHP has students learn to test claims, evaluate evidence, and use primary and secondary sources, including digital materials and timelines, maps, graphs, and photographs, in addressing essential questions. They use this evidence in writing informational and argumentative texts, developing graphic materials, and creating multimedia presentations.

Not only are students continually reviewing a range of sources, but the frequent argumentative writings and the periodic debates provide opportunities to build the 12th grade skills of “Distinguishing valid arguments from false arguments when interpreting current and historical events.” In the Investigation Writing, “Was farming an improvement over foraging?” in Unit 7, students confront the prevailing assumption that the march of progress towards agriculture was an unalloyed good and, consequently, consider an alternate reality. In debating “Is Change Accelerating” in Lesson 9.1, students argue that innovation either can or cannot keep up with accelerating population growth and climate change; thus updating their understanding of Malthusian cycles.
Big History also provides opportunities for students to build their ability to locate and choose resources in the course of completing the numerous assignments that involve researching topics. Students begin writing researched essays early in the course in Unit 2. Writing activities start with researching questions offered by the course and writing comparison-contrast essays across given and researched source materials (e.g., comparing a famous and a neglected scientist for a lesson 2.0 essay). Writing activities then work up to developing their own questions and goals for group and individual reports in the final Little Big History project. In the initial part of the course, given materials outnumber independent searches; however, by the end of the course, students are routinely using the Internet and other research sources for their own purposes.

**Writing:** Writing is a key component of students' knowledge production in Big History. Students engage in formal and informal writing continuously throughout the course in ways that more than meet progress indicator WHST.9-10.10, “Write routinely over extended time frames (time for reflection and revision) and shorter time frames (a single sitting or a day or two) for a range of discipline-specific tasks, purposes, and audiences.”

Students are required to write explanations and arguments drawing from texts, representations of data, experiences, videos, and other sources of information. As noted earlier, students engage in short-term and long-term research writing throughout the course. Students also write compare-and-contrast essays using primary and secondary sources. To assess and learn from these writing assignments throughout the course, a writing rubric is utilized. The rubric addresses the following categories of skills:

- Students engage frequently with the rubrics used in BHP, using them to evaluate sample texts, their own writing, and to engage in peer response. This practice builds metacognition in writing, and makes expectations for academic writing explicit for all learners.

**Investigations:** In parallel with the content of the course, Investigations challenge students to use complex and varied texts (e.g., primary and secondary sources, quantitative data, and graphics). Students take up and address big and enduring questions (“Why do people change their minds?” “To what extent has the Modern Revolution been a positive or negative force?”). Investigations engage students in short, focused research, using BHP-provided documents, artifacts, and objects to make arguments and explanations about change over time, culminating in a written presentation and assessment of their findings. Each Investigation asks students to answer a Unit’s driving question by analyzing, synthesizing, and evaluating evidence to construct their own answers, while developing student literacy and critical thinking skills. Each Investigation asks students to:

**Little Big History:** The Little Big History (LBH) project demands that students use advanced search methods to gather information and evidence from multiple authoritative print and digital sources while maintaining and sustaining their focus on a researchable question. This reflects our attempt to realize the goals of the Common Core in an engaging and constructive activity. The LBH calls on students to employ at least two approaches to knowledge in addition to History (such as Cosmology, Chemistry, Biology, or Anthropology) and take their research back to a time before humans. Student papers in the past have ranged from histories of an element (such as silver or gold), to a commodity (such as bananas, tobacco, or Cheez-Its), to events or activities (such as formation of dictatorships or the cinema). In short, the LBH project calls upon students to conduct a research project framed around a self-generated question; narrow or broaden their inquiry when appropriate; analyze and synthesize multiple sources; and demonstrate their understanding of different audiences. To complete this sustained research project, Big History expects students to:

**Conclusion**

The Big History Project provides an opportunity to widen student perspectives, give them practice in grappling with large, foundational concepts, and develop essential disciplinary and literacy skills through engaging materials and activities. The provided materials are rich and designed to promote substantive classroom interaction around essential questions.
